

Govern complex AI work without pretending.

A Codex Skill for red/blue/judge governance, independent-session evidence, controlled writes, and validation discipline.

One loop, separate jobs, visible evidence.

MAGG turns quality improvement into a bounded governance loop. No role writes final files until the judge allows scope.

A thread is only real with a session boundary.

Same-session roleplay can help, but it cannot be claimed as independent multi-thread review.

Red-1

session id
project path
minimal input

own outbox

Validation levels keep claims honest.

Every report separates verified, failed, not verified, environment gaps, and cannot claim.

L0 Static

L1 Rules

L2 Use Path

L3 Outcome

Self-optimization starts with evals, not edits.

A skill can improve itself, but MAGG requires a baseline, pass/fail criteria, no-leak prompts, and an audit trail.

Ship artifacts with a visible audit trail.

This repository packages the MAGG Skill, visual README diagrams, and a shareable PDF/PPTX storyboard for explaining the governance model.
